ESETE AGRO

Website Requirements & Implementation Brief

A simple, mobile-friendly product catalogue that the shop owner can manage independently

Business: Esete Agro | Location: Merkato, Gojam Berenda, Addis Ababa, Ethiopia | Contact/WhatsApp: +251 939 806 318

Prepared for the website developer

Platform preference: Lovable (lovable.dev) • Editable, owner-managed website

1. Project overview

Build a straightforward public website for Esete Agro, an agricultural-inputs shop in Addis Ababa, Ethiopia. Customers should be able to browse products, read descriptions, see prices where provided, and contact the shop. The owner must be able to sign in to a private administration area and add, edit, hide, or remove products without needing a developer or writing code.

The first release is a product catalogue and enquiry website, not a full e-commerce checkout. Customers can ask about availability or place an enquiry through WhatsApp or the contact details. Online payments, delivery tracking, and customer accounts are outside the initial scope unless agreed separately.

2. Main goals

- Make the shop and its products easy to discover and understand on mobile phones and computers.
- Let the owner maintain product photos, names, descriptions, prices, categories, and availability independently.
- Make contacting the shop through WhatsApp or telephone easy from every important page.
- Reflect the supplied Esete Agro poster: agricultural, trustworthy, clean, green-and-white visual identity.
- Keep the website simple enough for a non-technical owner to manage after a short handover.

3. Business details and brand direction

Business name	Esete Agro
Tagline	Growing Together for a Better Tomorrow!
Primary message	Quality products for better farming
Telephone / WhatsApp	+251 939 806 318

Shop address	Merkato, Gojam Berenda, Addis Ababa, Ethiopia
Primary language	English for the first version
Currency	Ethiopian Birr (ETB); owner can enter the price for each item
Visual style	Agricultural green, white, natural photography, clear typography, uncluttered layout

Use the supplied Esete Agro poster as a visual reference, not as a substitute for real product data. The developer should not assume every item shown in the poster is currently stocked or legally available. The owner must confirm product names, labels, prices, stock, and any required registrations before publishing.

4. Website pages

4.1 Home page

- Header with Esete Agro logo/name, navigation, and a prominent WhatsApp/contact action.
- Hero section with the headline “Quality products for better farming”, a short introduction, and a “Browse Products” action.
- Category tiles for Herbicides, Insecticides, Fungicides, Fertilizers, Sprayers & PPE, and Seeds. Only show categories that the owner uses.
- Featured or recently added products managed from the admin dashboard.
- A short “Why Esete Agro” section. Use only claims the owner can substantiate; avoid unverified promises such as guaranteed results.
- Contact section with telephone/WhatsApp and the shop address.
- Footer with business name, navigation, contact details, and a safety/legal note for agricultural chemicals.

4.2 Products catalogue

- Display products in a responsive grid with image, name, category, price (if entered), and availability status.
- Allow visitors to search by product name and filter by category.
- Provide sorting options such as name and newest; do not show a price sort unless price data is available.
- Each product card opens a product detail page.
- If the owner has not entered a price, show “Contact us for price” rather than inventing or displaying zero.
- If a product is unavailable, mark it “Out of stock” or hide it from the public catalogue according to the owner's setting.

4.3 Product detail page

- Product name, product photographs, category, description, price or “Contact us for price”, and stock/availability status.
- Relevant details such as brand, package size, formulation, active ingredient, and intended use only when confirmed by the owner and product label.
- A clear “Ask about this product on WhatsApp” action that opens a pre-filled message containing the product name.
- A contact alternative for visitors who do not use WhatsApp.
- For regulated agricultural chemicals, show only verified label and safety information. Do not invent application rates, mixing instructions, safety claims, or legal approvals.

4.4 About page

A concise introduction to Esete Agro, the products it supplies, and its commitment to supporting farmers. Keep the text editable or straightforward to update. Do not invent the company's history, certifications, partnerships, or years of experience.

4.5 Contact page

- Clickable phone number and WhatsApp contact.
- Shop address: Merkato, Gojam Berenda, Addis Ababa, Ethiopia.
- Optional map embed or directions link, added only after the owner confirms the exact map pin.
- Optional enquiry form with name, phone/email, message, and consent notice. If implemented, validate fields and protect against spam.

5. Owner administration dashboard

Create a private, password-protected admin area. It must be usable by a non-technical shop owner on a phone or laptop. Only authenticated and authorized users may access product management.

5.1 Admin functions

- Secure sign-in and sign-out.
- Dashboard overview showing total products, published products, drafts/hidden products, and out-of-stock items.
- Add a new product using a clear form.
- Edit any existing product.
- Upload one main image and optional additional images; preview images before saving.
- Save as draft or publish to the public catalogue.
- Mark as in stock, low stock, or out of stock. A precise quantity field is optional but useful.
- Edit price and choose whether to display the price publicly.
- Assign and change product category.
- Unpublish, archive, or delete products, with a confirmation step before deletion.
- Preview the public product page before publishing.
- Show a helpful success or error message after each action.

5.2 Product fields

Field	Required?	Notes
Product name	Yes	Clear customer-facing name.
Category	Yes	Choose from the categories managed by the owner.
Short description	Yes	A concise summary for product cards.
Full description	Recommended	More detail on the product page.
Price	Optional	Numeric amount in ETB; allow “Contact for price”.
Price visibility	Yes	Show price or hide it and display a contact action.
Main product image	Recommended	Upload from phone or computer; validate file type and size.
Additional images	Optional	Support multiple images if feasible.

Availability	Yes	In stock, low stock, out of stock, or unavailable.
Brand / package size	Optional	Only when confirmed from the product packaging.
Product label / safety details	Conditional	For regulated products, use verified label information.
Featured product	Optional	Lets owner select items to highlight on the home page.
Publication status	Yes	Draft, published, or archived.
Created/updated date	Automatic	Set automatically by the system.

5.3 Categories

Start with these suggested categories: Herbicides, Insecticides, Fungicides, Fertilizers, Sprayers & PPE, and Seeds. The owner should be able to rename categories, add new ones, and hide categories that are not in use. Products should not be forced into a category that does not fit.

6. WhatsApp and enquiry flow

- Use the supplied number +251 939 806 318 for the main WhatsApp action, after the owner verifies that it is the correct business WhatsApp number.
- On a product page, the WhatsApp message should be pre-filled with a simple enquiry such as: “Hello Esete Agro, I would like to ask about [Product Name]. Is it available, and what is the current price?”
- Do not imply that an order is confirmed merely because a visitor clicked WhatsApp. The shop confirms price, stock, and order details directly.
- If a product price changes, the owner must be able to update it without developer assistance.

7. Design and user experience

- Mobile-first design; product cards and admin forms must work well on narrow screens.
- Use deep agricultural green for primary elements, white or off-white backgrounds, and restrained lighter-green accents.
- Use the supplied poster for brand direction, but avoid putting all poster text into one image as the website content. Text, buttons, product cards, and navigation must remain readable and accessible.
- Use consistent product image ratios and crop images cleanly without hiding important packaging information.
- Use readable font sizes, sufficient contrast, clear focus states, and descriptive button labels.
- Provide loading, empty, error, and success states. The catalogue should explain what to do when no products match a search.
- Avoid unnecessary animations, pop-ups, and complex features that make the website hard to maintain.

8. Technical and data requirements

- Build the initial version in Lovable, using a maintainable structure and a real persistent database/storage solution rather than temporary browser-only data.
- Use a secure backend/database and image storage appropriate to the Lovable project. Supabase is an acceptable option if suitable and configured correctly.

- Product changes made in the admin area must persist after refresh, sign-out, and sign-in, and must appear on the public site as expected.
- Implement authentication and server-side authorization. Hiding admin buttons in the interface alone is not security.
- Restrict admin access to the owner and explicitly approved staff. Public visitors must not be able to create, edit, or delete products.
- Validate input on the client and server. Sanitize text and use safe handling for uploaded images.
- Compress/resize images where appropriate and use lazy loading for catalogue images.
- Set page titles, meta descriptions, social sharing previews, and meaningful image alt text.
- Use a custom domain if the owner has one; otherwise deploy to a suitable hosted URL and explain how the domain can be connected later.
- Provide a backup/export approach for product records and clear instructions for restoring or transferring ownership of the project.

9. Security, legal and product-safety considerations

- Use HTTPS and secure authentication; never store passwords in plain text or expose secret keys in frontend code.
- Use least-privilege database rules so the public can read published product data but only authorized admins can change it.
- Confirm all listed products and their legal sale status with the owner. Do not assume items pictured in the supplied poster are approved, available, or safe for every use.
- For pesticides and other regulated agricultural inputs, publish accurate product-label information and any locally required warnings or restrictions. Do not create unsupported claims, application rates, mixing advice, or safety guidance.
- Do not market restricted or banned products as available. The owner is responsible for confirming applicable Ethiopian requirements and supplying correct documentation.
- Collect only the personal information needed for enquiries and explain how it is used. Do not add tracking or marketing subscriptions without appropriate notice/consent.

10. Recommended implementation phases

Phase 1 — Confirm details: Owner confirms logo, contact details, exact map pin, product list, real prices, stock, product labels, and who will administer the site.

Phase 2 — Build the public site: Create home, catalogue, product detail, about, and contact pages using responsive green-and-white branding.

Phase 3 — Build admin dashboard: Implement authentication, product/category management, image uploads, pricing, availability, drafts, and publishing.

Phase 4 — Connect data and WhatsApp: Connect persistent storage and database rules; verify enquiry links and contact actions.

Phase 5 — Test and launch: Test all user journeys, permissions, image uploads, mobile layout, and deployment.

Phase 6 — Handover: Train the owner, deliver credentials securely, document backups, and confirm the owner can independently manage products.

11. Acceptance checklist

- ☐ A visitor can open the website on a phone and computer.
- ☐ A visitor can browse products, search, filter by category, and open a product detail page.
- ☐ The website displays entered prices accurately and shows “Contact us for price” when no price is set.
- ☐ The WhatsApp action opens the correct contact and includes the selected product name.
- ☐ The owner can sign in securely and sign out.
- ☐ The owner can create a product, upload an image, add a description, set a price, choose availability, and publish it.
- ☐ The owner can edit an existing product and see the public page update.
- ☐ The owner can hide/archive a product and it no longer appears publicly as a normal available item.
- ☐ A public visitor cannot access admin functions or modify data.
- ☐ Product data and images remain saved after refreshing and signing in again.
- ☐ The site works on common mobile screen sizes and has no broken navigation or obvious layout issues.
- ☐ The developer has provided the live URL, project ownership/access, database/storage access, and a short owner guide.

12. Deliverables required from the developer

Working deployed website and public URL.

Owner-managed admin dashboard and secure sign-in.

Configured database and product-image storage.

Responsive pages and working WhatsApp/contact links.

Source/project access and ownership transferred or shared with the business owner.

A short written guide showing how to add/edit products, upload images, change prices, mark stock status, and publish/unpublish products.

A short handover/training session and a list of any recurring hosting, database, domain, or service costs.

Confirmation of what is included and what would cost extra, such as online payments, multiple languages, delivery management, or advanced inventory.

13. Out of scope for the first version

Unless separately agreed, the first version does not require online checkout or payment processing, delivery tracking, customer accounts, loyalty points, a full accounting system, advanced warehouse management, or automatic inventory integration. These may be considered later after the catalogue and owner workflow are working reliably.

14. Questions to resolve before launch

Does the owner want prices visible to everyone, or should some products display “Contact us for price”?

Will one person manage the site, or should the developer create separate accounts for multiple staff members?

Does the owner already own a domain name?

Should the website later support Amharic in addition to English?

Which products are currently in stock, and has the owner verified their exact names, prices, labels, and legal status?

Is the supplied telephone number also the correct WhatsApp Business number?
